

Master Thesis - Zebra finches

Paul Ecoffet

The 6th of June, 2017

Abstract

The Zebra Finches are songbirds which learn the song of their tutor. They learn it from 25 days post hatch (DPH) to 90 DPH ([liu_juvenile_2004](#)). Zebra finches are commonly used as a model of speech acquisition.

[deregnaucourt_how_2005](#) showed that sleep plays an important role in the learning of tutor songs. Indeed, they showed that sleeping has a negative impact on song restitution by zebra finches in the short term but a positive impact on the long run. Song restitution is less complex and less similar to the tutor song from one morning to the previous day evening, but the greater this loss in performance was overall for one bird, the better this bird was able to reproduce the tutor song at the end of its learning.

In addition to that, [dave_song_2000](#) have found neurons in the motor cortex which fires sequences during sleep that correspond to their activity pattern when the birds sing in adult zebra finches. This shows that motor neurons that are highly correlated with bird's own song (BOS) are activated during the night. These identified replays suggest that some learning may occur during sleep that use past experiences.

Our hypothesis is that during its sleep, the zebra finch restructures the knowledge it has acquired so far thanks to replay mechanisms. We hypothesize that this restructuring can account for the loss of performance in the short term and an improvement of performance in the long term.

The goal of this internship is to offer a model of the zebra finch song learning which can explain different behavioral data observed such as the correlation between the loss of performance every night and the overall performance at the end of learning.

Contents

1. Introduction

1.1 Zebra finch song learning

The Zebra Finches are songbirds which learn the song of their tutor. They learn it from 25 days post hatch (DPH) to 90 DPH (**liu_juvenile_2004**). Zebra finches are commonly used as a model of speech acquisition.

Why model of speech acquisition: * fast learning (90 days) * Learning during development **margoliash_offline_2003**
* Very reproducible result with a tutor song that the bird will mimic its whole life **margoliash_sleep_2010**
* Close ended learners vs open-ended learner **margoliash_sleep_2010** * Many-to-many relationship between auditory feedback and muscle outputs **margoliash_offline_2003**
* Can be easily raised domestically (Rosenfield) * More localised brain structure (Rosenfield) * Can study circuitries

The stages of learning * subsong, plastic, cristallization **margoliash_sleep_2010**

1.2 Neuroscience

1.3 Sleep

deregnacourt_how_2005 showed that sleep plays an important role in the learning of tutor songs. Indeed, they showed that sleeping has a negative impact on song restitution by zebra finches in the short term but a positive impact on the long run. Song restitution is less complex and less similar to the tutor song from one morning to the previous day evening, but the greater this loss in performance was overall for one bird, the better this bird was able to reproduce the tutor song at the end of its learning.

dave_song_2000 have found neurons in the motor cortex which fires sequences during sleep that correspond to their activity pattern when the birds sing in adult zebra finches. This shows that motor neurons that are highly correlated with bird's own song (BOS) are activated during the night. These identified replays suggest that some learning may occur during sleep that use past experiences.

* Replays can explain learning **margoliash_offline_2003** * Consolidate learning * Needed to reach new sounds **margoliash_offline_2003** * replays with weird burst inside **margoliash_evaluating_2002**

1.4 Sum up

Our hypothesis is that during its sleep, the zebra finch restructures the knowledge it has acquired so far thanks to replay mechanisms. We hypothesize that this restructuring can account for the loss of performance in the short term and an improvement of performance in the long term.

The goal of this internship is to offer a model of the zebra finch song learning which can explain different behavioral data observed such as the correlation between the loss of performance every night and the overall performance at the end of learning.

1.5 Previous models for birdsong learning with Zebra Finches

* Preference for same species songs `margoliash__evaluating__2002`; `marler__three__1997` * `marler__three__1997`
* `coen__learning__2007`

2. Our proposed model

I build the model in Python.

2.1 Global architecture

2.1.1 Terminology

Tutor song The tutor song is the goal song the agent try to reproduce.

Song Model A song model is the representation of the motor commands an agent has to produce a song.
A song model is composed of several gestures, with the associated parameters and duration.

Song structure The song structure is the agencement of the gestures. Without modifying the parameters of a gesture, the song structure can change by inserting a new gesture, deleting one or changing the length of a gesture.

Gesture ?

Learning model ?

2.1.2 Overview

2.1.3 Memorisation of the tutor song template

* Tutor song is known by the bird “by heart” [deregnaucourt_how_2005](#); [margoliash_sleep_2010](#)
“Exposure to a song model, either from a live tutor (e.g. father or other male) or song playback, typically results in the production of a good imitation of the tutor song. For learning to occur, birds only need to hear the song template during a short critical period in their life suggesting that auditory encoding of the song template and the process of vocal imitation are two separate events”

source?

2.1.4 Day learning model

* hillclimbing * Optimize gesture but not song structure

2.1.5 Night learning model

* Microbial GA * Optimise only song structure, not gestures

2.1.6 Satellite Modules

Bird song analysis package

* Imported from matlab

Synthesizer

* Cythonized and debugged

3. Results

3.1 Syllables development trajectories

3.2 Influence of song model restructuration on learning

4. Discussion

5. Conclusion
